# 1 Research question

1. Determine whether there is an association between blood colour components (CIE L\*a\*b\*) and fraction of oxygenated haemoglobin.
  2. Generate a predictive model of the (CIE L\*a\*b\*) colour component from fraction of oxygenated haemoglobin.
-

## 4 Prepare data

```
# Convert Animal ID to a factor
data %<>%
  mutate(Animal_ID = factor(Animal_ID,
    levels = c('I1', 'I2', 'I3', 'I4', 'I5',
               'I6', 'I8', 'I9', 'I10', 'I11')))
```

## 5 L\*

### 5.1 Exploratory plots

#### 5.1.1 Linear model

```
# Composite plot
ggplot(data = data) +
  aes(y = l_star,
      x = FO2Hb,
      fill = Animal_ID) +
  geom_point(shape = 21,
            size = 3) +
  geom_smooth(se = FALSE,
            size = 0.8,
            method = 'lm',
            fill = 'blue') +
  scale_fill_viridis_d(name = 'Animal') +
  labs(title = 'FO2Hb vs L*',
       subtitle = 'All animals together\nRegression line is simple linear model',
       x = 'FO2Hb (%)',
       y = 'L*')
```

### FO2Hb vs L\*

All animals together

Regression line is simple linear model

```

# Small multiples
ggplot(data = data) +
  aes(y = l_star,
      x = O2Hb) +
  geom_point(shape = 21,
            size = 3,
            fill = '#FFFFFF') +
  geom_smooth(se = FALSE,
            size = 0.8,
            method = 'lm') +
  labs(title = 'F02Hb vs L*',
       subtitle = 'Facetted by animal\nRegression line: linear',
       y = 'L*',
       x = 'F02Hb (%)') +
  facet_wrap(~ Animal_ID,
            ncol = 3)

```

## FO2Hb vs L\*

Facetted by animal  
Regression line: linear

### 5.1.2 Quadratic model

```
# Composite plot
ggplot(data = data) +
  aes(y = l_star,
      x = O2Hb,
      fill = Animal_ID) +
  geom_point(shape = 21,
            size = 3) +
```

```
geom_smooth(se = FALSE,
            size = 0.8,
            method = 'lm',
            fill = 'blue',
            formula = y ~ poly(x, 2)) +
scale_fill_viridis_d(name = 'Animal') +
labs(title = 'FO2Hb vs L*',
      subtitle = 'All animals together\nRegression line is a quadratic polynomial model',
      x = 'FO2Hb (%)',
      y = 'L*')
```

## FO2Hb vs L\*

All animals together

Regression line is a quadratic polynomial model

```
# Small multiples
ggplot(data = data) +
  aes(y = l_star,
      x = O2Hb) +
  geom_point(shape = 21,
            size = 3,
            fill = '#FFFFFF') +
  geom_smooth(se = FALSE,
            size = 0.8,
            colour = 'blue',
            method = 'lm',
            formula = y ~ poly(x, 2, raw = TRUE)) +
  labs(title = 'FO2Hb vs L*',
```

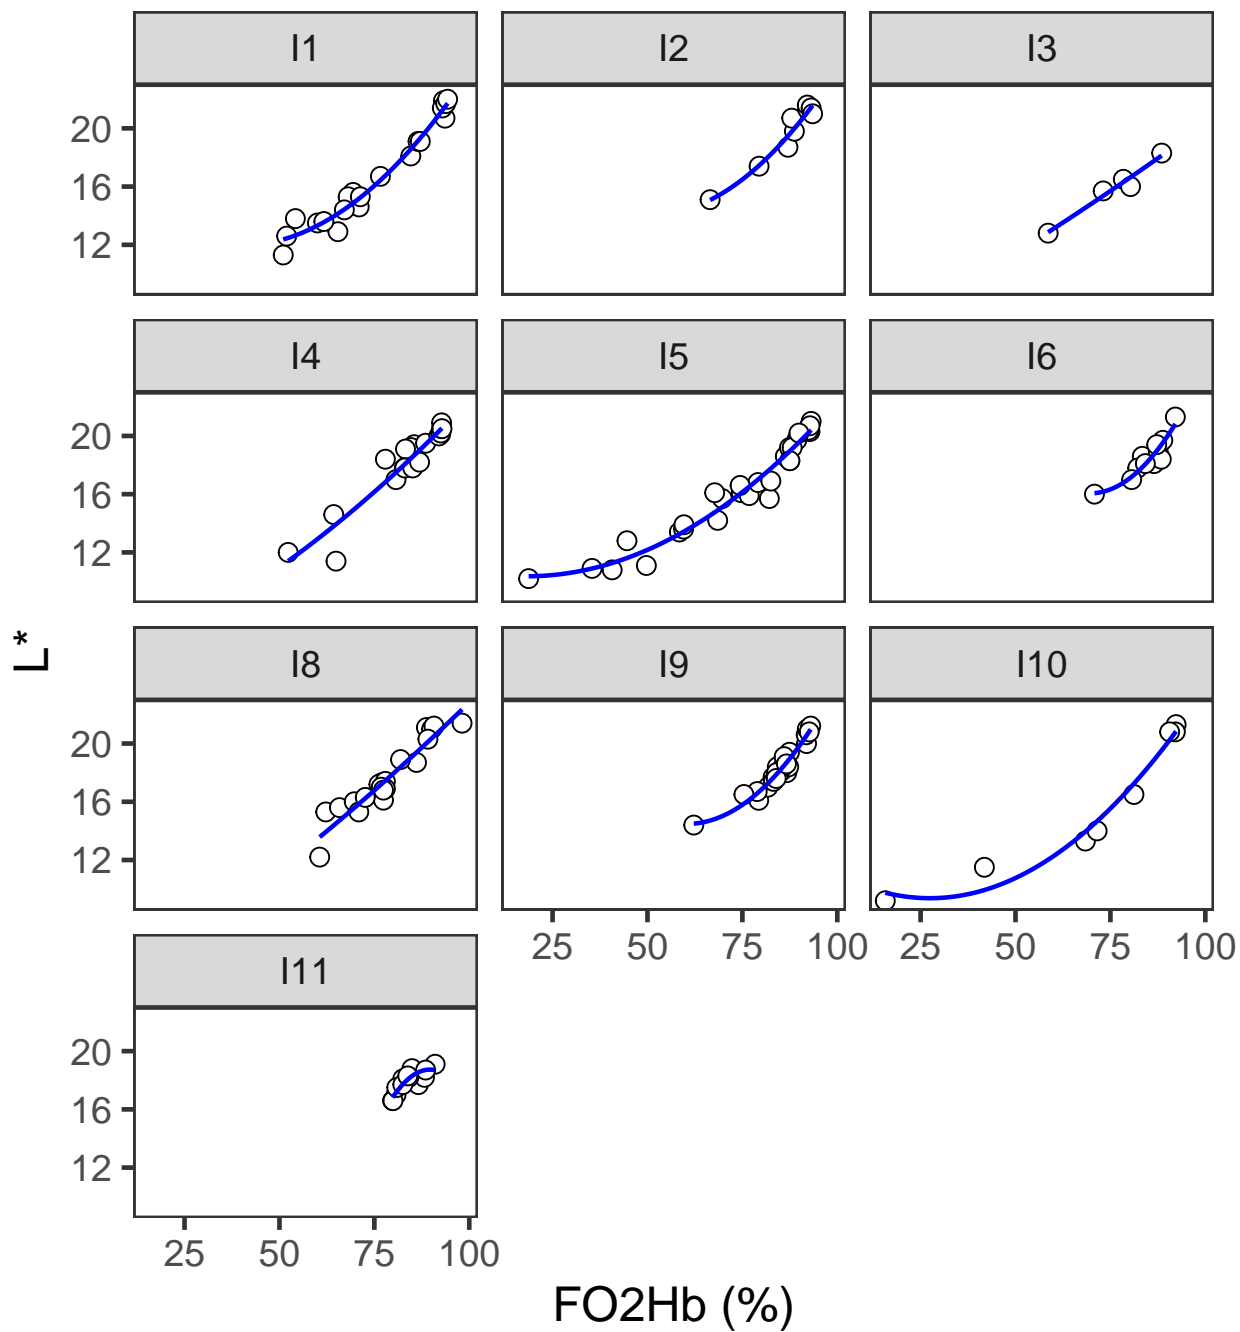

```

subtitle = 'Facetted by animal\nRegression line: quadratic polynomial',
y = 'L*',
x = 'FO2Hb (%)') +
facet_wrap(~ Animal_ID,
ncol = 3)

```

## FO2Hb vs L\*

Facetted by animal  
Regression line: quadratic polynomial

## 5.2 Model selection

Model selection based on the outcome of likelihood ratio test of goodness of fit.

```

# Null model
lstar_null <- lmer(l_star ~ 1 + (1 | Animal_ID),
                  data = data,
                  REML = FALSE)

## First-order polynomial (linear) model
lstar_linear <- lmer(l_star ~ O2Hb + (1 | Animal_ID),
                   data = data,
                   REML = FALSE)

## Second-order polynomial (quadratic) model
lstar_poly <- lmer(l_star ~ poly(O2Hb, 2) + (1 | Animal_ID),
                  data = data,
                  REML = FALSE)

## FO2Hb vs b\*

95% prediction interval

### 7.5 Generate predicted values

```
# New data
bstar_grid <- expand.grid(O2Hb = c(15, 25, 35, 45, 55, 65, 75, 85, 95),
                          Animal_ID = 'I12')

# Generate predicted vs independent variable O2Hb
bstar_predicted <- predict(bstar_poly,
                           bstar_grid,
                           allow.new.levels = TRUE)

# Tabulate
data.frame(O2Hb = bstar_grid$O2Hb,
           bstar = bstar_predicted) %>%
  kable(caption = 'b* predicted values',
        col.names = c('FO2Hb (%)', 'b*'))
```

Table 8: b\* predicted values

FO2Hb (%)	b*
15	9.932111
25	9.904795

FO2Hb (%)	b*
35	10.701137
45	12.321137
55	14.764796
65	18.032113
75	22.123088
85	27.037722
95	32.776014
